

ELB v1.20 Update Instructions

What you need:

1. Your ELB version must be 1.19. This is the version that can be downloaded from the OceanLogic website (www.oceanlogic.com).
2. Your ELB must be OFF.
3. You need either the ELB_v1.20_Update.zip or ELB_v1.20_Update.iso files downloaded from the OceanLogic website.

What is going to happen?

1. The ELB updater creates a copy of the ELB in a new directory, C:\OceanLogic\ELB_2012, and then updates the new copy.
2. You will delete your old desktop ELB shortcut and create a new one.
3. You will then use the new copy.
4. If any errors occur during the update or the updated version causes any problems you can still use the original copy.
5. The new copy will display the version 1.20 in the About Electronic Logbook form that is called up from Help. The updated version allows you to record salmon avoidance on hauls which is noted on the daily log reports.

How to run the Update:

1. Make sure the ELB is turned OFF.
2. Unzip the ELB_v1.20_Update.zip or .iso files into a temporary directory. For example C:\Temp. Once completed the temporary directory should contain a file called ELBUpdater.exe and a folder called Update Files.
3. Double click the ELBUpdater.exe file that was just created. This will start the update program.
4. Press the Run Update button. If your ELB is installed anywhere other than C:\program files\OceanLogic\ELB you will be asked where it is located. Otherwise the update will occur automatically.
5. If the update occurs successfully the updated ELB will be located at C:\OceanLogic\ELB_2012.

6. If the update is not successful try rebooting your machine and running the update program again. If that still does not work you can continue using the existing version. Call or email OceanLogic at (907) and let them know what happened.

7. Once the ELB update is complete you can delete the temporary directory where the ELBUpdate.zip file was unzipped into.

Update you ELB desktop shortcut:

If your update was successful you should update your desktop ELB shortcut.

1. Delete the old one.
2. Open the C:\OceanLogic\ELB_2012 directory using My Computer or Windows Explorer.
3. Right click ELB.exe in the ELB_2012 directory and select Create Shortcut.
4. Drag the new shortcut onto your desktop. Right click it and rename it to ELB if you wish.
5. Double click your new shortcut and make sure you have started the updated ELB by selecting About from under the Help menu and verifying that the version is 1.20.

How to use the update

1. You will see a new checkbox on the Hauls Form called "Salmon Avoided". If your haul was interrupted by the need to avoid salmon place a check into this checkbox.
2. You will see this new value printed out on your printed daily log.
3. This information is also sent to NMFS in the export file.
